## Belief Update

After reaching  $s'$ , the agent observes  $o \in \Omega$  with probability  $O(o \mid s', a)$ . Let  $b$  be a probability distribution over the state space  $S$ .  $b(s)$  denotes the probability that the environment is in state  $s$ . Given  $b(s)$ , then after taking action  $a$  and observing  $o$ ,

$$b'(s') = \eta O(o \mid s', a) \sum_{s \in S} T(s' \mid s, a) b(s)$$

where  $\eta = 1 / \Pr(o \mid b, a)$  is a normalizing constant
